Hey All, I realize this has probably been asked before, however I am a fairly new DBA of SQL Server.

I have just finished setting up SQL Server on our new hardware, and I have used the previous day's compressed backup files to quickly copy the databases from one server to another. I then restored the databases on the new server. The only trouble is, each of the databases have Users that do not exist as Logins on the new server.

Is there an easy way to load all of the security login information from my old server to the new server, such that it uses the same IDs in the background, so that I don't have to rebuild the security settings?

FYI: I am moving from SQL Server 2000 SP3 on Server 2000 to SQL Server 2000 EE SP3+Hotfixes on Advanced Server 2003, if that makes any difference.

Thanks,
