

## Permission Denied to object

We recently brought up SQL Server and migrated our Access 2000 back end DB to it. The SQL Server security seemed pretty straight forward to me...I set up the users and the roles and assigned the roles rights to my tables. The problem is that my users get a Permission Denied error when ever the Access 2000 front end tries to access any SQL Server table unless I add them to the System Administrator server role. I've gone over everything and I can't seem to figure this out. The only thing I can find that seems strange is that on that database, my login name is associated with the "dbo" name. I think that makes me the owner of the db and I'm wondering if that is what is causing my issue. I'd greatly appreciate any insight on how to get this issue taken care of.

Thanks in advance!

Jim
