Hello -- we have SQL Servers running in a Service Bureau environment. How clients frequently use applications at their sites to access our SQL Server. Unfortunately, some of our clients are more sophisticated than others and know about Enterprise Manager and Query Analyzer, which they can try and use outside of our application... assuming they know a login/password into SQL.

For those clients that know our SQL Login/Password, and since our application doesn't use application logins, is there a way I can block EM/Query Analyzer access from our clients and keep it available for us internally? Obviously, I cannot block port 1433, but I was hoping I can restrict the apps from being used externally.

Thanks
