Hi

After installing SP4 on our company SQL200 Standard Server, we get the following error on all client computers (WinXP, Win2000) that are using our local application that is accessing sql database

What could be the problem? No settings were changed, only SP4 was installed.

Any help will be appreciated

Regards

Miha

Socket Error # 10054

Socket error (#10054): Connection reset by peer.

Analyse & Solutions: An existing connection was forcibly closed by the remote host. This normally results if the peer application on the remote host is suddenly stopped, the host is rebooted, the host or remote network interface is disabled, or the remote host uses a hard close (see `setsockopt` for more information on the `SO_LINGER` option on the remote socket). This error may also result if a connection was broken due to keep-alive activity detecting a failure while one or more operations are in progress. Operations that were in progress fail with `WSAENETRESET`. Subsequent operations fail with `WSAECONNRESET`.
