Hello everyone,

I discovered a security hole that I would like to close. There is a SQL Account with only read permissions. However, from a remote computer a DTS package can be scheduled by using this account by creating a job to run from this remote computer to our production database. How can I prevent a job outside of the production database from making a connection using a SQL account.

Thank you for your time!

p.s. I did denywrite but it still allows the connection.
