Hi!

Any ideas on how to audit *select* statements with SQL 2005?

This is a pretty common requirement with databases where one needs to keep track of who-saw-what.

Oracle has had it for ages... wasn't able to find it anywhere for sql 2005... but need the functionality.

Regards,

Joe

My recommendation would be to require all users access data through a defined set of stored procedures. You can audit access to those stored procedures you need audit simply by logging access to the procedure in an audit table.
