Hello I am getting:

"login failed" (Error 18456) error messages in SQL Server 2005 Error is 18456, Severity: 14, State: 8.

I have tried to logon to other databases and this isnt possible. I get the same error message. Creating new logins, and triple-checking the passwords did not help. The database engine will not allow any logons to any database. The other engines seem to be fine.

This still means that I do not have permissions for any of the databases. This is using any of the local or domain accounts. I cannot log onto any of the databases. I have tried to attach using SQLCMD and I cannot get logged in to the database.

The log files show success from earlier in the day and week for these same accounts.

I created this problem by detaching one database running on the server. I went to connect the datafiles and now I cannot get into the server at all. I am using SQL2005, Sharepoint services and a Windows 2003 server. I would appreciate any insight or suggestions.

.
