I have a SQL 2000 Enterprise Edition sp4 production database that is log shipping to 2 servers (one for DR purposes and the other for reporting). On the reporting server, the database is in Read-Only mode. I need to add another user to the database so they can run reports. How can I do this with the database in read-only mode? I can't take it out of read-only because I'll have to set up log shipping all over again, won't I? This is a 40 GB database so that would take quite some time to do.

Do you have any suggestions?

The only way is to add that user to a role that has access... you could create a server role that has SELECT permissions for all objects, but I'm not sure that a new role's access would be grand-fathered into an r/o db.

Unfortunately, the only built-in role that leaves you with is sysadmin... but it's worth a try.

-Mark

Thank you.

Toni
