Thanks for the reply,

I just use a query window within the management studio. I run the sql statement as a SQLuser and it works. I change the connection properties to my windows account (with administrator privileges) and it stops working.

Yes, the windows account will need access to the file on the file system as well as be a user with enough privileges on the database to perform the insert. Are you using BCP or are you using SSIS to do the transfer?

Hi,
We've got this strange situation. I want to perform a bulk insert in SQLserver 2005 from a file on the file system. This works OK when I use a SQLuser. When I do the same logged in with windows account (with administrator privileges) I get an error. I thought that when I use a windows account, this account is used to access the file system. When you use a SQL account then the user of the sqlserver service is used to access the filesystem. Am I wrong or how does this work ?

TIA
