

Assigning Permissions to a Database

I'm trying to grant a user full access to a database.

Although I've given this user the role of db_owner, he still doesn't have the same access as, for example, the "dbo" user.

When I look at the table permissions, the "dbo" user has everything selected while my user has nothing selected. Do I have to go into each table and manually assign these permissions or can I somehow apply all of the permissions using the database roles?

Thanks!
