No error other than invalid user name and password.

Yes the password is valid, I use it to connect with the SQL Server Management Studio using SQL Server Authentication and the SA is set with server role "sysadmin"

I am just wondering if there is something in SQL 2000 that is automatically on that is not turned on in SQL 2005 for this authentication to take place.

Are you getting an error back? Did you set an SA password when you installed SQL2k5?
