Not necessarily all that easily without knowing when it may have been dropped. Third party log reading tools can give you information on schema changes for whatever logs, log backups you load for the tool to read. Some tools are listed at:

<http://www.aspfaq.com/show.asp?id=2449>

Or ff you were running a trace during the time it may have been dropped....but that's about it on SQL Server 2000.

Is there a way to find out which user dropped my table in SQL Server 2000 and when? Thanks.
