Then run a trace that filters on the application. If you run profiler you can see what SSMS uses as an application name and simply use that as a filter. Then you will see everything for only SSMS. But if you are going to do this full time you will want to use TRACE instead of profiler and send the trace to a file for viewing later.

Yes, I would like to see exactly what has been executed through SQL Server Management Studio (this is SQL Server 2005).

PL.

What exactly do you mean by "Log"? Are you looking to keep an audit trail of select statements issued thru EM?
