Uri,

Adding the domain account which runs SQL Server into SQL Server doesn't make any difference. Note the account I use to logon to the server is a local admin on the server and even this account cannot connect to the SQL Server if it is running under the domain account. The domain account domain\blah has the following group access Domain Users, Local Admin-SQL(grants local admin to all SQL Servers), Logon Exec - exception from account ager lock-out. On the server the account is assigned to the following local admin rights: ACT Part of OS, Logon Batch, LOgon Service and Replace Process Token.

If I change the account running SQL to Local system everyone

can logon. Any idea what is going on?

It is because there is BULTIN\Administrstors Login that alllow access to everyone who is a memeber of LOCAL Administrators Group

> connect to SQL Server are the domain account running SQL Server and SQL

Server accounts. No other domain accounts can access SQL. The following is the error which we get " A connection couldn't be established. Reason: login failed for user (NULL) Reason: not

Re: Problems changing the password for the service account in SQL

associated with a trusted SQL Server connection".

Let me understand you. You have a domain account group that SQL Server Services run under (you have a login in SQL Server DOMAIN/blblbla) , so now you are saying that "no other domain accounts can access SQL" , so I think you need to add this account to DOMAIN/blblbla group OR create a login for this domain account in SQL Server

The account which SQL Server is running under is a Domain account and it doesn't matter whether MSSQL Server is running Windows Authentication or mixed security no one using a domain account can logon

What is an account MSSQL Server running under?

Is that Windows Authentication or Mixed?

We are currently in the process of Moving all our SQL Server 2000 servers from Windows 2000 using NT security over to Window2003 using Activity Directory. We have migrated the Service account and password over to the new domain and have installed SQL Server successfully using this account. We have now testing changing the password. We

Re: Problems changing the password for the service account in SQL

changed the password on the domain controller and then in SQL Server and now the only accounts which can connect to SQL Server are the domain account running SQL Server and SQL Server accounts. No other domain accounts can access SQL. The following is the error which we get " A connection couldn't be established. Reason: login failed for user (NULL) Reason: not associated with a trusted SQL Server connection". If I change the account running SQL to Local system everyone can logon. Any idea what is going on?
