SQL Server 2000 + SP4 .

Sql Server service , startup manual, Startup account : Local System  
I can start the service, the client application can connect, everything is OK.

SqlAgentServer, startup : manual, Startup account: Local System.  
When I start the server Agent manually it stops immediately.

In the Application event log I have:

1. Error: "SQLServerAgent could not be started (reason: Unable to connect to server '(local)'; SQLServerAgent cannot start)."
2. Information: "SQLServerAgent service successfully stopped."

In the ...Management->Sql Server Agent/ Display Error Log I have 2 error messages:

1. "[165] ODBC Error: 0, Cannot generate SSPI context [SQLSTATE HY000] "
2. "[000] Unable to connect to server '(local)'; SQLServerAgent cannot start"

If I change the Startup account to a Local Administrator the server agent service starts without any problems.

Any ideas why don't start my service with the Local System account.
