Hi

After moving them to the logical choice of securityadmin, EM reports errors about not having access to select data from syslogins and such.

Can you elaborate a little bit what does it mean?

Might I ask how any of you have addressed this sort of scenario, where you have DBA's and security administrators as separate entities?

No at our shop, however, there is security admin server role.
Read about Fixed Server Roles in the BOL

At the company I work for, we have security personnel that handle assigning privileges to databases and object. The security personnel themselves used to be in the sysadmin fixed server role. After moving them to the logical choice of securityadmin, EM reports errors about not having access to select data from syslogins and such.

Might I ask how any of you have addressed this sort of scenario, where you have DBA's and security administrators as separate entities?

Allen
