So, as long as a user has permissions to execute a stored procedure, the stored procedure will execute correctly even if the user does not have explicit permissions defined for the objects consumed within the stored procedure?

yes, it will , unless you have dynamic sql within a stored procedure , then you'll have to grant permission on undelaying tables

If the user has permissions to execute a stored procedure but that the user is explicitly denied permissions to objects consumed by the stored procedure will the stored procedure still execute correctly?

Yes , it will

Let's say that I have a view that has no explicit permissions  
defined  
for  
users. Let's also say that I write a stored procedure which  
uses this  
view.

Now, if I give explicit permissions to a user to EXEC the  
stored  
procedure,  
will the procedure execute correctly even if I don't explicitly  
give  
permissions (such as SELECT) for the user to the view?
