logged in as userx

exec usp_ListDatabasesForLogin return

EXECUTE permission denied on object 'usp_ListDatabasesForLogin',
database 'databaseA', owner 'dbo'.

but sa(admin) can

meanwhile i have created Newsp_helplogins under master and this will
update the

new_userdb_Table with dbname and user (#tb2_PlainLogins is removed)

but then userx cannot exec this too.

how do i set permission to run and "not to create" a sp for a user ?

or call a trigger that will run the sp as sa(admin) or if possible
any user and retrieve data from the table.

.
