Jan,

You need access to one of the SQLAgentxxxRole(s) in msdb.

There are 3 SQLAgentxxxRole(s) that have different levels of permission. See BOL for more details.

I am a newbie to SQL 2005 and trying to understand the permissions. When I run SQL Management Studio with an account that is not a local admin on the remote SQL Server, I can't see the SQL Agent node at all. What permissions do I need to set in SQL so that I can see that node.

Thanks

Thanks, that's just what I was looking for.
