I am using a server side trace to help track down why some data is being deleted. One of the events that I've included is #50 – SQL Transaction (exp. begin, commit, save, etc..). My problem is that I'm only getting notification of this event. I was hoping to be able to capture some text in the 'TextData' column that I also included in the server side trace. I'd like to know what type SQL Transaction commands are being used.

Any ideas?

TIA

.
