Sorry Erland. Didn't notice it was from someone else. Much thanks to you also.

Take care.

J

J (IDontLikeSpam@xxxxxxxxxxxx) writes:

Do you know of a recommended method in doing this for a form with multiple fields which allows a user to specify more criteria on multiple fields? Seems like building the dynamic sql statement in the stored procedure with the specified field parameters is the only method I can think of to do multiple criteria searching but I guess I still would like to avoid.

I discuss a whole bunch of solutions in both dynamic and static SQL, as well as some very interesting hybrids in an article on my web site: <http://www.sommarskog.se/dyn-search.html>.
