Hi, I have a server running sql server 2000 sp3. In this sql server we use windows authentication to allow users to use the applications that were developed in house.

At this moment we have some users that are using excel to get data from databases but we don't want they do that, because we can't control the data they are getting.

We want to restrict that all users can get data only using the applications that are developed in house.

Do you know if in sql server I can restrict wich applications can be connected to sql server and wich not??

I need to continue using windows authentication.

Thanks a lot for your help.

If a user has permission to connect they can.
