And one other thought....if you changed the authentication to SQL Server and Windows Authentication from Windows Only, the service needs to be restarted for those changes to take affect. Maybe you changed to allow SQL Authentication but haven't restarted the service?

From what tool, application or what steps result in the error message "Login failed for user 'ID'. The user is not associated with a trusted SQL Server connection."

Does this involve a connection string at all or are you trying through SQL Server tools?

I thought that was the issue as well. I checked and I have SQL Server and windows Auth checked and I'm still getting the error.

This is nerve racking. I've been trying to figure this out most of the morning.

John,

Is your SQL Server configured to only support Trusted Connections?

On the Security tab of Server Properties there are two radio buttons:

- \* Windows Authentication Mode
- \* SQL Server and Windows Authentication Mode

Re: User ID issue – urgent

If you have the first selected, then a SQL Server account cannot login.

Could that be the problem?

I'm trying to create a new user ID for a database on my box, I keep getting the message

'Login failed for user 'ID'. The user is not associated with a trusted SQL Server connection.

I add the ID under the default security tab, then associate that id to the database I want the ID linked to. what am I doing wrong with this?
