I posted this to server group and didn't get any response. Maybe this group is more appropriate.

Has anyone ever seen, <Using 'xpweb70.dll version '2000.80.20390' to execute extended stored procedure 'xp_runwebtask.'> in the Application Log of Event Viewer? The "escalation of privilege" vulnerability was supposed to be already fixed in SP3. Any idea why it's logged, although it's only an Info Type instead of Warning or Error?

Thanks,
Eli
