Hello. I was wondering if someone could help me understand better about assigning a user to multiple roles. I created a role for some developers from another group to be able to to DTS over some data (select, insert, delete, update) into our local tables from their sql server. I also assigned them to the db_ddladmin role. They tried to DTS our new data and looked like they were able to delete the data in our local tables but their bulk insert command to insert the data wasn't successful. I read and thought that when assigning a user multiple roles the role with the most priveleges takes in effect?

I would guess that rather all privs are unioned together, and DENY takes precendence over GRANT.

In any case, BULK INSERT requires membership in the bulkadmin server role, which you don't seemed to have assign to your users.
