I need to put SQL server 2005 on our 2003 IIS server. The server is accessible to the public. My question is, what do I need to do to secure the sql server? The windows 2003 server has SP2 and is fully patched, and I intend to install all the latest patches for the SQL as well.

Is there a good tutorial/how-to article. I don't want to "just install" the sql then put it in production, unless that is ok...
