How can I retrieve a list of objects and permissions for a specified role?

Our DBA has recently left us so I've been tasked with determining how the permissions are set up on a SQL Server 2005 box. I'm using SQL Server Management Studio to try to assess this. Presently in one of the databases, there is a role he defined which I know is widely used. When I right-click the role and go to properties, none of the schemas are checked as "owned". There's basically nothing listed under the "Securables" tab and likewise for Extended Properties. Somewhere the permissions are defined for this role, I just don't know where. This tool is beyond counter-intuitive.

Essentially: How do I see and manipulate the permissions for a user-defined role (or any for that matter) from within Sql Server Management studio?

Thank you very much
