Hi ,

How could I query a SQL Server 2005 dataserver instance through my Java Program if it is running in SSL mode or not ?

I am using a third party JDBC driver to establish SSL connection with a MS SQL SERVER 2K5 dataserver but my connection fails when the dataserver is restarted in Non – SSL mode. So , I need a way to first query the database if its running in SSL mode or not so that I can prepare my queries accordingly to make a decision at runtime.

Thanks to you all genius in advance !!

.
