Execute sp\_who to list current activity. Perhaps there is a rogue process blocking your request.

Hope this helps.

I have one table that I cannot grant permissions on.

I have tried through Enterprise Manager and by executing at statement like:

```
GRANT SELECT on dbo.YYY to ThisRoleName
```

I am db owner. I kicked everyone out of the database so I am the only person in there. I can grant permissions to any other table in the database. But when I try to grant permissions to table YYY the request eventually times out.

Any ideas would be most appreciated!
