How about dropping those users using their UIDs?

Strange problem.

I attached databases from a SQL7.0 server in domain A on a SQL 2000 server in domain B.

When I try to drop de database users with the sp_dropuser command I get the message user does not exists.

Strange thing is that when I execute sp_helpuser I can see the users but when I execute SP_Change_users_login 'report', there not listed.

Those users are domainusers.

Anyone an idea what's causing this. the only way to delete them is via the EM or via the sysusers.

Regards
