Hi.

I am crrently running SQL Server 2005, I have an Excel VBA application that exacutes a number of stored procedures against the database, this database is restored every evening so needs a login created on it every time the restore job runs. I believe the script should look a little like this for creating a Login and User

```
USE [Database]
CREATE LOGIN ExcelKPI WITH password='ExcelKPI',
Default_Database = [Database]
CREATE USER ExcelKPI FOR LOGIN ExcelKPI
WITH DEFAULT_SCHEMA=dbo_owner
```

And then I need to Grant necessary permissions, e.g. Insert & Update

It runs fine and creates the logins but still doesn't work, I have to then go to the main security tab and give the login Sysadmin rights to get it to work which I am sure shouldn't be necessary, I am probably just not setting it up correctly.

Could anyone offer some advice.

Thanks P
