That has nothing to do with encrypting the columns. Look up Encryption for SQL Server 2005 in BooksOnLine for details of how this works.

Hi Andrew,

Thank you very much for your answer. I have found information about this issue and it says the same. Otherwise, can i make a connectionstring with user and password to restrict the access from code or do i have to use always "Integrated Security=True"?

Best regards

If the end user has sa rights on that server they can see what ever they wish by default. You might want to think about encrypting those columns and using a key that your app supplies to decode them.

Hi,

¿Are there any way to protect a database that is redistributed with a desktop application? I want to protect this database with an user and a password, something like access, but with

Re: Password MDF

SQL Server 2005, if you have SQL Server 2005 Management Studio, you can access without any problems and you can see all database objects.

Thanks a lot
