Hi All,

I'm going to implement a standalone solution to my company's partners, which is a VB.NET application with some \$\$ calculations. Some rate data are sensitive and we choose to use sql server express 2005 as local database engine.

My concern is that, how can I protect my id & password to access sql express?

At least I need to code it inside VB.NET SqlConnection in order to access the rate, and the code in VB.NET could be reversable, I afraid if someone can hack into the code and discover the login credential.

Is there a way to prevent it?

Thanks.

.
