hey Chris

you would need to gather some more information in order to start troubleshooting. it could be as simple as a beaconing netcard that needs replacing.

whats going on in the event logs on your DCs?  
what domain design do you have?  
what is the physical infrstructure between the workstation and the nearest DC?  
how are you communicating on your LAN – TCP/IP?  
are you using DNS/WINS/DHCP?  
how is active directory deployed in your enviornment?

hth

ps. drop me an email if you like, just take the 'nospam' out the address

Mike
