Hi,

I want my application running on Win 2000 pro to be used in a kiosk, this is going to be standalone computer.

I would like to change to custom user interface (instead of explorer.exe) only for a group of users. I tried to set this using group policy snap-in by setting value for local comp policy -> user configuration -> admin templates ->system -> custom user interface.

Problem with this approach is that the changes affect all users including Administrator. I would like to have default explorer interface for Administrative users and custom UI for another group.

I suspect that the reason for this is I do not have active directory on this 2000 pro system and I was told that Active directory can be set up for 2000 server only.

Is there any way I can achieve this.

Regards

Rajesh Parikh
