Hi,

In Windows, users can open several sessions at the same time in one domain. For example, one can log into a domain twice by log in from 2 different workstations with the same username/password.

How can I implement the function that exist on Mainframe security software, such as IBM RACF or CA Top Secret, to prevent a user to open 2 concurrent session on a domain?

The user can log from any workstation in the company.

OS: server: Windows 2000 Advance server SP2

Station: Windows 2000 Pro. SP2

Thanks for your help,

Nam
