unless these pc's are not part of a domain and have local accounts on each pc, what a mess.

if they are part of a domain, and have the "must change password at next logon" checked they will need to do so, also if there password change ever x number of days enforced, they will have to do so then too.

> *This is not correct. The password only changes once in a domained environment. The authentication has nothing to do with the workstation. Obviously the user accounts have been setup to ask the user to change password the first time they logon. This will only happen once and not anytime they logon to any machine, because all is taken care of on the server.*
