Hi All.

I'm faced with problem: I can't launch application on remote machine with DCOM.

I have Client-Server application developed on COM technology.

I want launch EXE-COM server on remote machine (Win 2000 Server) with DCOM in security context of interactive user of caller machine (client).

DCOM reports "Access denied" on message box on client and in Event Viewer I can read message "General Permission Denied."

If I try launch COM server locally with DCOM it's all right. Remote launching is unsuccessful.

How I can get to client permission to launch application on remote machine? Include in specific group ? Edit local security policy ? Anything else ?

Thanks for any regards.

Sergey.
