Upon attempting to limit the password to get into the system, we deleted the administrator's password. Although it listed Administrator, the user, and Guest, the user's password was the Administrator's password. Now we can not get back into the system to retrieve the documents in My Documents.

The hardware manufacturer recommended reloading Windows 2000 which we did but in a different folder which was an option to keep from loading an empty My Documents on top of the other. But we still are unable to retrieve the documents stored in the original My Documents because it shows only the empty My Documents.

Was the original My Documents lost? If not how can I get to the stored documents? After retrieving the original documents, how do I get rid of one set of programs that have been loaded in the separate folders? When it boots up, it gives me the choice of one folder or the other before opening Windows. Thus indicating that I may be using double the memory space than what should be used.
