Marina,

Yes, it is part of the local computer administrator's group. I received an email from someone regarding this post that said,

"We have a large number of HP scanners that we cant use at the school with windows 2000. The HP install program puts the driver in current user section of the registry and when you log on as anything else, even a diferent administrator other than the one that installed the unit you are a diffrent current user."

I'm not sure how this affects this from a rights perspective, but maybe this will help with some ideas.

I was out of the country for a week and didn't have access to the internet, so sorry about my delayed response.

Thanks again for your interest and help.

Craig
