I have enable auditing on my Windows 2000 server (SBS 2000) for Logon/Logoff event so that I can audit who is logging on and off the domain. I have done this by setting the security settings in Domain Controller Security Policy.

The security log has hundreds of event (mainly system) and is filling up the log very quickly. I was surprised about this as I only have 10 users. I have increased the log size to 4mb but is still full within a day or two.

Can anyone suggest how I can control this so the log does not fill so quickly

Thanks

Richard
