Okay backup a second – how are you allowing users to connect to FTP? If you want to truly disable all access to IUSR_computername, you have to make certain that NOTHING is allowing impersonation. Here is how I configured FTP in a quick test to confirm that IUSR is not authenticating with the FTP service properly configured and IUSR disabled:

Goto IIS master properties for the site, edit, goto directory security, edit Anonymous acces and authentication control. Change type to Basic, clear the anonymous access checkbox. Goto the default website properties and do the same thing. Next, goto the FTP site, administer properties, click on Security Accounts tab, uncheck "allow anonymous connections" and apply the changes.

Disable IUSR_computername account in users and groups. Enable logon/logoff events in local security policy.

Restart IIS at the master properties level, login to FTP, do an ls or a dir, whatever, then do a bye. Check events logs. I'm seeing the administrator username login and out, not IUSR.

hth,

Jason
