Under the security tab of a particular folder, Add individuals who are members of the administrator group and set "deny" permissions for them. That will override the grant permissions they have being a member of "Administrators". Now of course, Administrator will still have access. Just limit who knows the administrator username and password; then explain to management that your in a similar role as the payroll person: Both of you have access to everyone's information because someone has to administer it; but you both know the responsibilities that come with that position.
