Im not sure if I am in the right posting, but lets see. My Windows 2000 Advanced Server has a SceCli 1202 error message occuring about every five minutes in the Application Log. Before this, I was not able to open Default Domain Controller Policy in administrator tools. "file path not found" I found the correct guid and copied it to the correct directory. This fixed a bunch of problems. Then I started getting the 1202 msg. "Security policies are propagated with warning. 0x534 : No mapping between account names and security IDs was done." I looked up Microsoft Knowledge Base Article 248472. Went through the steps. I found out that this is not a user account, but it was the Power Users group. Does anyone know how to fix this? Thanks in advance!
