If you are using at least SP3 I believe, you can configure Windows Updates by schedule which does not require administrator intervention. Software Update Services is free from MS and allows you to add your own update server to the domain on a W2K or W2003 server running IIS and allows you to download and approve updates and service packs for distribution via your lan and then you can use Group Policy to configure Windows Update for network clients. --- Steve

<http://www.microsoft.com/windowsserversystem/sus/default.msp>
<http://www.bris.ac.uk/is/services/computers/operatingsystems/sus/configuring.html> --- example how to configure client for scheduled update and how to configure clients via Group Policy.
