well, first you get rid of the network administrators. then you get each computer on the network it's own connection to the internet, its just too easy to monitor traffic through a central router. then you get everyone a secure proxy account like anonymizer.com provides so their surfing is 'private'. then you get rid of your central mail server and get everyone separate accounts on something like hushmail or some other secure encrypted mail service. and oh yeah, you get rid of your file server and any central printers since its too hard to make them private, get everyone their own big disk and encrypt them with their own keys with no recovery agent so no one can snoop... and a local printer so no one can watch what they print... and don't forget the shredders. of course by then the company probably couldn't function any more or would already be bankrupt so your last step is to print your resume on your personal private printer and pack up your desk cause you just lost your free surfing 'privileges'.
