The default warning period is 14 days as defined in the security options of the appropriate security policy. There is no way to temporarily give users an override when they are told their password has expired – they must change it then to logon or access resources in the domain. Any users who have "password never expires" in their user account properties will not be subject to maximum password age and after you implement a maximum password age, the affected users that have a password older than the maximum will have their password immediately expire. Be sure to warn users of impending change. A user can use the "net user username" command to find out when their password expires and you can use the free Dumpsec tool from SomarSoft with the dump users feature to find out the age of you users passwords and a whole lot more. --- Steve
