Hi

I have a OWA server behind a ISA server. The same certificate is installed on both servers. The common name on OWA server is "webserver"  
When I hit internally my OWA server <https://webserver/exchange> the log on window comes up, but when I hit externally my OWA server <https://10.10.10.10/exchange> I receive this message: There is a problem with the site's security certificate – The name on the security certificate is invalid or does not match the name of the site"

I have to click YES in order to get the log on windows ...

How can I fix this warning?

Thanks
