If the server is a member of a domain there may be Group Policy user configuration applied to it to restrict that applications that can not run on it. Otherwise check local Group Policy via gpedit.msc and drill down to user configuration/administrative templates/system to see if there is a list of applications in the don't run specified Windows applications. If it is not defined, set it to disabled. Also see if the run only allowed Windows applications is enabled. If it is a domain computer also use the gpresult support tool to see what user configuration Group Policies are applying while you are logged onto that computer and any of those policies could be suspect. --- Steve
