Such can be done through delegation on the service properties.

No matter how you do it this will be a permission but you may distribute it to may machine by using a policy.

On each service there are properties --- on the secure tab there are permissions available to be delegated.

> *I have a group of developers who I wish not to grant administrative access to, but require the ability to bounce their applications which are service based. I've looked in the local security policy but do not see anything that stands out as being able to do this.*

Look in the Services control panel or in a GPO->Windows->Security->Services
